

Group 3 Photographing report

Activity - Photographing

* Boko Stream site filming briefly made an overview story of the present activities and the past
(From Past)

1 We have few details of Boko stream. Boko stream was located in the eastern end of Barana Community nature and heritage park. As from the past centuries Boko stream was remain natural, later in seventies and eighties there have been some disturbance of logging activity that operating beside Boko stream and its catchment. From the past Boko stream was respected because it contribute to support few needs of our old desidant in their livelihood and they enjoy it very much, they also have a respect for it, and very careful of doing such activities interms of disturbing that stream. because they have a huge concern about their livelihood. This is a few details we have about Boko stream.

(At Present time)

From this present time Boko stream have lost its natural looking and its catchment. It was affected by many activities such as logging from the past, milling, gardening and it free for anyone to do anything they want, more importantly no one have any respect on it and its catchment so for us ~~are~~ present generation we seen a huge change because we dont enjoy it like our past generation, with-in our knowledge for this present time we are lossing our natural benefits of our ~~na~~ natural resouces. Our future is not looking better so it might a big problem for the future generation we really dont know what would be like we think it would be a desastress for their ~~thier~~ if we dont care and control all activities we do in our resouces for this Present time.

● Advise statement from our group through our finding with the help of this ~~res~~ research project. this ~~res~~ assessment

help us with a very good knowledge and some idea of really thinking for the present and the future of our resources because its really contribute alot for our livelihood. and ~~it~~ also very impotan why? or d during disaster time interm of natural disaster seasons

Group 3 field survey report

A few knowledge about

Volana Ngadi Stream now nonas Bakso

Knowledge from the Past.

Volana Ngadi stream its one of the Tabu stream in respect of what our ancestors do during their time, because there was very useful, its a stream that they use to wash and clean everything they use for the sacrificial worship for their god. That is the reason why they respect Volana Ngadi stream. they respect and they don't want any ~~of to do~~ ^{one ano do} any activities inside and beside that stream. After our ancestor stop doing traditional sacrifice in 60 centuries, 70-80 people start to bringing in some new style of activities within that area which is change the nature of that area and stream. (* Gardening * Logging * milling) and not show respect to that stream.

Our ancestors have very high respect of the forest, rivers and streams, they also have some rules to follow, and they obey, respect and listen to their elder people

- * Rules: not allowed to cut tree along the river side (bank)
- * Gardening near the streams, and unauthorise diving or traditional ways of catching fish from rivers and streams. In the forest they also have some rules to followed. * Don't cut trees which is you ^{don't} have any use for it, or some other species of bush material. → (Harvesting): Harvesting usefully happen when the season of these things appear in few natural sign which base on nature. During their time they base on nature to study the weather and the season for the right time to harvest and bad season not to do harvesting.

Present Image of Volana Ngadi Stream

Through this research my group find out to compare with the past story about that stream. it really show us the really change of our natural resources its no longer like the image of the past as through this finding we show many activities have its impac in our ~~re~~ resources. All Forest a distroed rivers, streams are affected with thoes activitie the habbitat of all living creatur a disturb by thoes activites and the right haverstting season ~~a~~ cant identified This are the most Challenging situation, interm of knowing the natural disaster could happen. because we really don't care for our natural resources and its contribution to our Livelyhood. Our huge problem is because we dont know how to manage our resouce and also a Problem of population increasing. other things is we live by many different culture and different style of living or different ways of doing things The 'most' Contributing fact is \$ dollar, most People think we live by money in order to sustain our living. its right but when use our resources we ~~to do not~~ do not think of the future generation; we don't have a knowledge of what would happen next. most they think about them self they really dont care of our resources. We also do not have a traditional knowledge about our Cultur and way how we live with natural enviroment and the benefite of it

Future Plan

Question. what we should do so that our futur generation would not affected in the future ~~dis~~ disaster interms of climate change as we already expreince now? My group came with the idea of start Organising ~~Peo~~ people with the Communities within our Island in Solomon to remember how was the past generation live. ask our self in what ways our past generation or our ancestors

do with nature. do they have rules respect and cultural ways of living with nature?

My group need us to think about past and this present time and do know ~~that~~ past and present, image of a natural environment. we think present is really show us how and what would happen in future.

The ~~q~~ question is, we have a complete ~~e~~ resources? if not, then we should start to think now, not just sitting down and don't worry about our future generation because their future is in our hands. We think and decide. We should learn from our ancestors how they respect nature, respect and do things without letting the elderly to know what they doing. this is how they manage their resources because they believe that their resources is so important to them. even the time of disaster they still survive, because they care for their resources. What we should do now, we should learn from our past generation, The people they believe that nature is protecting them. not only for natural disaster, also in some ~~sicknesses~~ sicknesses that they will happen if they don't respected their natural environment
